

Flexi Sign - Where Are My Presets?

Flexi 8.6 works a little different when it comes to Presets. Now, instead of choosing a Preset in Rip & Print, you will need to choose an Output Profile. Keep in mind you can still use Preset PTF files created for previous versions of Flexi but you will have to convert them to work correctly in 8.6. This can be done in Production Manager by going to Setup>Color Profiler>Convert Legacy Preset. Then click on the folder icon for Add Preset, browse to your PTF file(s), open, then click Convert. The media preset you converted will then show up correctly under Output Profile in Rip&Print. (Note: DO NOT bring in Preset files in 8.6 by using the Import Preset function under the file menu in Rip & Print.)

If you still need additional Presets (which you will have to convert) you can find links to them at the technical support page on our website at <http://dencosales.com/DencoTechnicalSupport.html>.
